Serbia*

Systems biology approach to serotonergic signaling

- Systems biology approach in unraveling polygenic disorders
 - gene \times gene interactions (*epistasis*)
 - gene \times environment interactions
 - \rightarrow huge phenotypic variability

Systems biology approach to serotonergic signaling

- Major depressive disorder (MDD)
 - Melancholic and atypical type
 - Antidepressant therapy response
- Monoamine hypothesis of depression: dysregulation of serotonergic transmission
- Major **neurotransmitter** system in central nervous system involved in regulation of food intake, mood and aggression

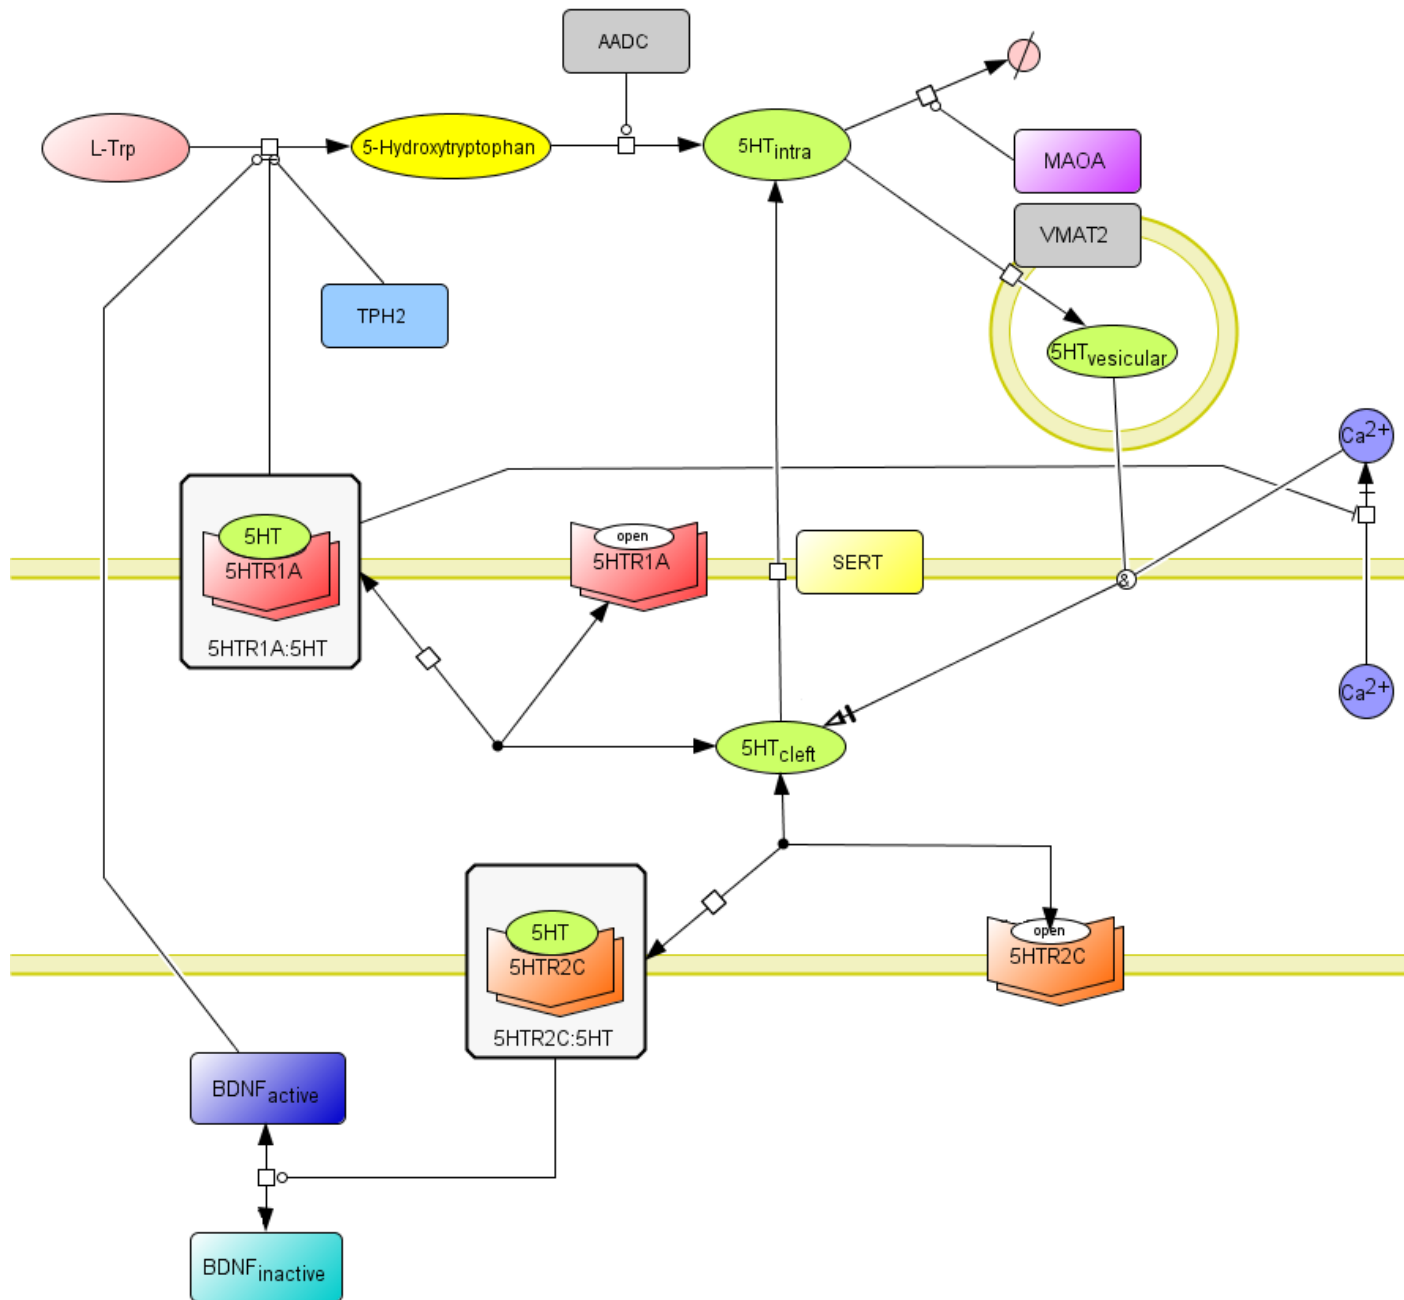

Serotonin
(5-hydroxytryptamine)

Modelling

- Computational modeling using Cell Designer v4.2 and Systems Biology Workbench
- Microarray data from wholebrain tissue sample from BioGPS
- Enzyme kinetics from BRENDA database
 - K_M
 - $V_{max} = E \times k_{cat}$
- Empirically estimated parameters

Synaptic functionality

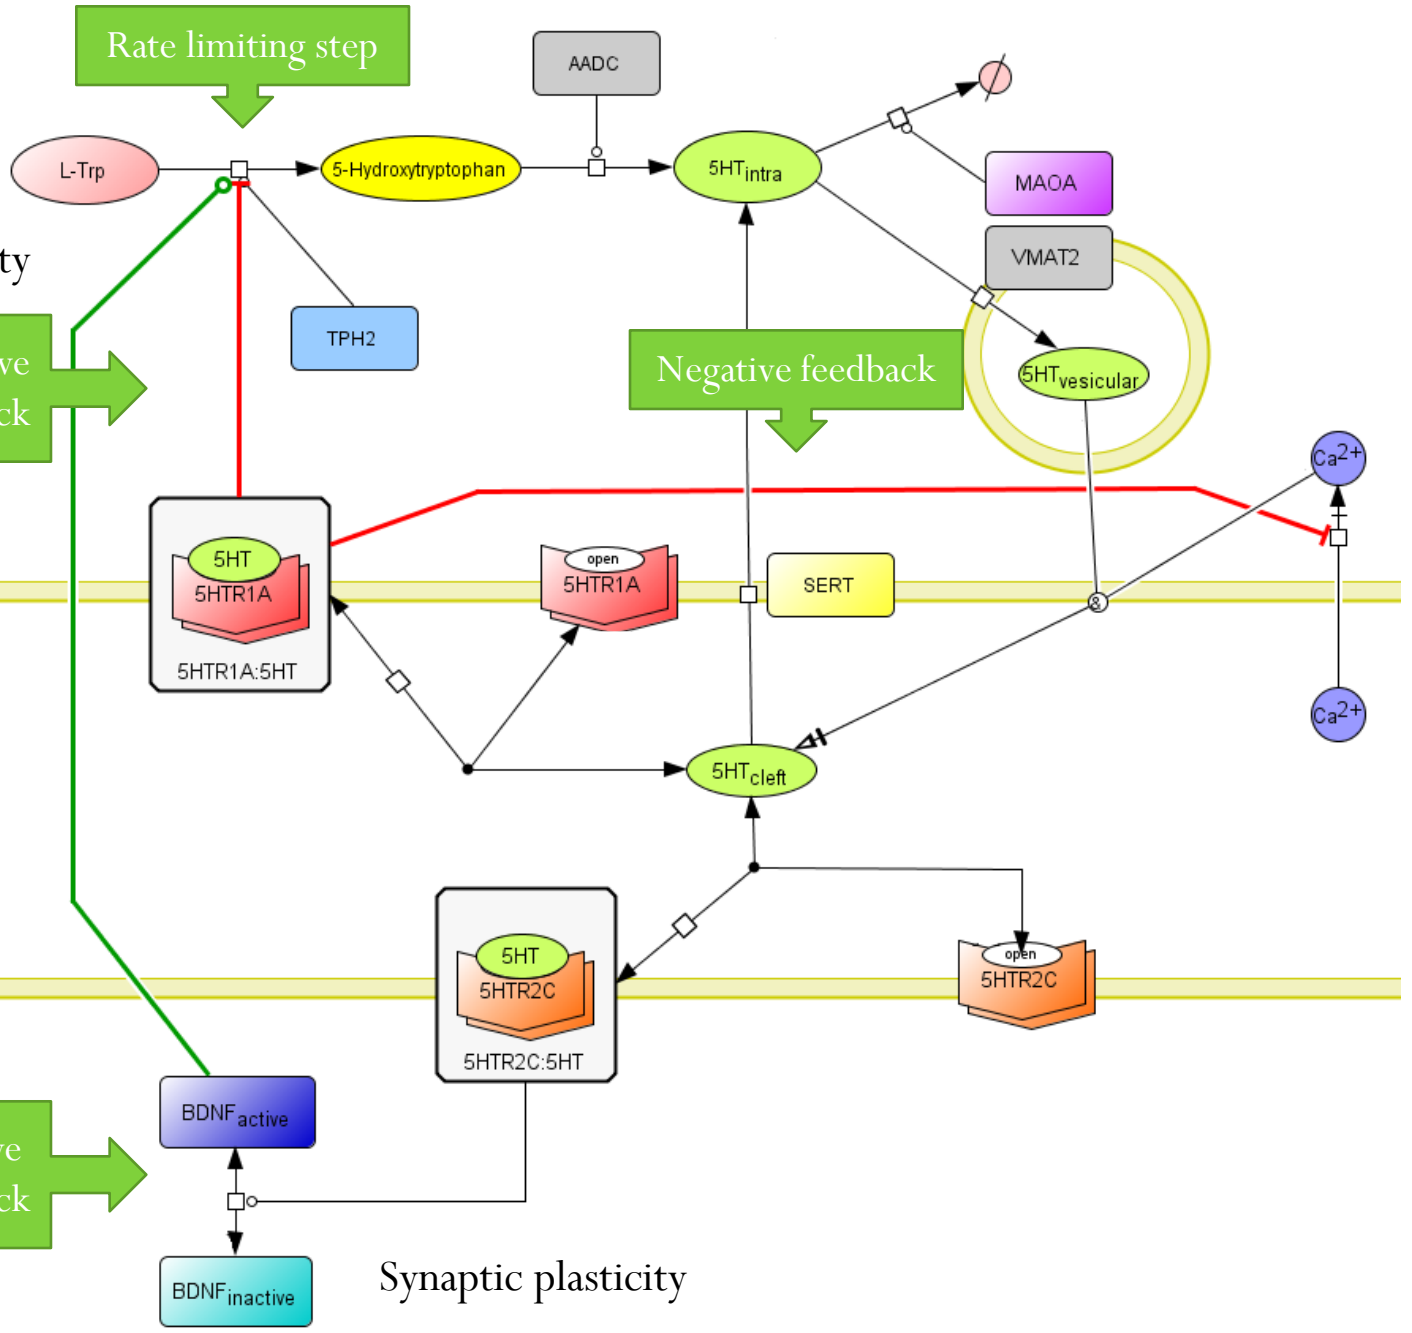

Negative feedback

Positive feedback

Rate limiting step

Negative feedback

Synaptic plasticity

System stability

- Nyquist plot
- $K = \text{open/closed}$
- 0.3-30 Hz
- System is robust and stable!

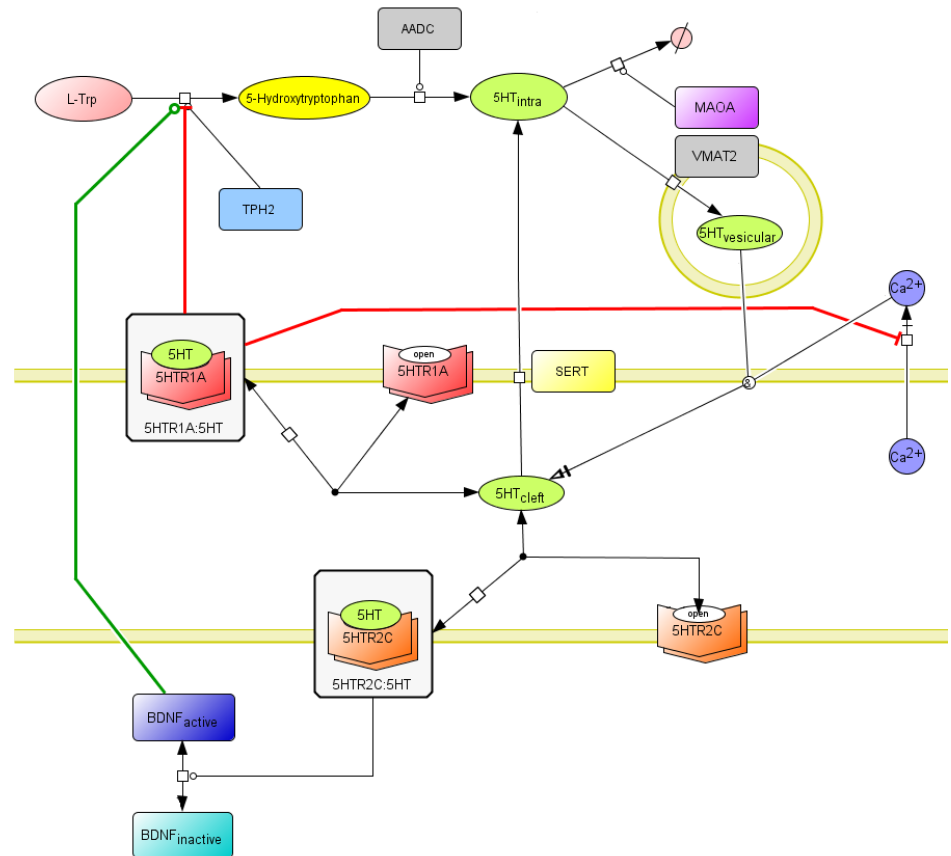

Analyzing complex phenotypes (1)

- 59 MDD patients and 81 healthy control
- Genotyping 9 loci in 6 genes

$$[E] = \frac{\sum_{i=1}^i k_i}{i} \times [E]_0$$

Gene	Variant	k_i	
TPH2	rs11178997	T = 1	A = 0.78
	rs4290270	A = 1	T = 0.5
	rs7305115	A = 1.74	G = 1
MAOA	uVNTR	2R = 1.2	3R = 1
		4R = 0.125	5R = 1.18
5HTR1A	rs6295	G = 1	C = 1.2
5HTR2C	rs6318	G = 1	C = 2.3
SERT	5HTTin2	9 = 2.4	10 = 1.2
	5HTTLPR	s = 0.8	l = 1
BDNF	rs6265	C = 1	T = 0.33

Analyzing complex phenotypes (2)

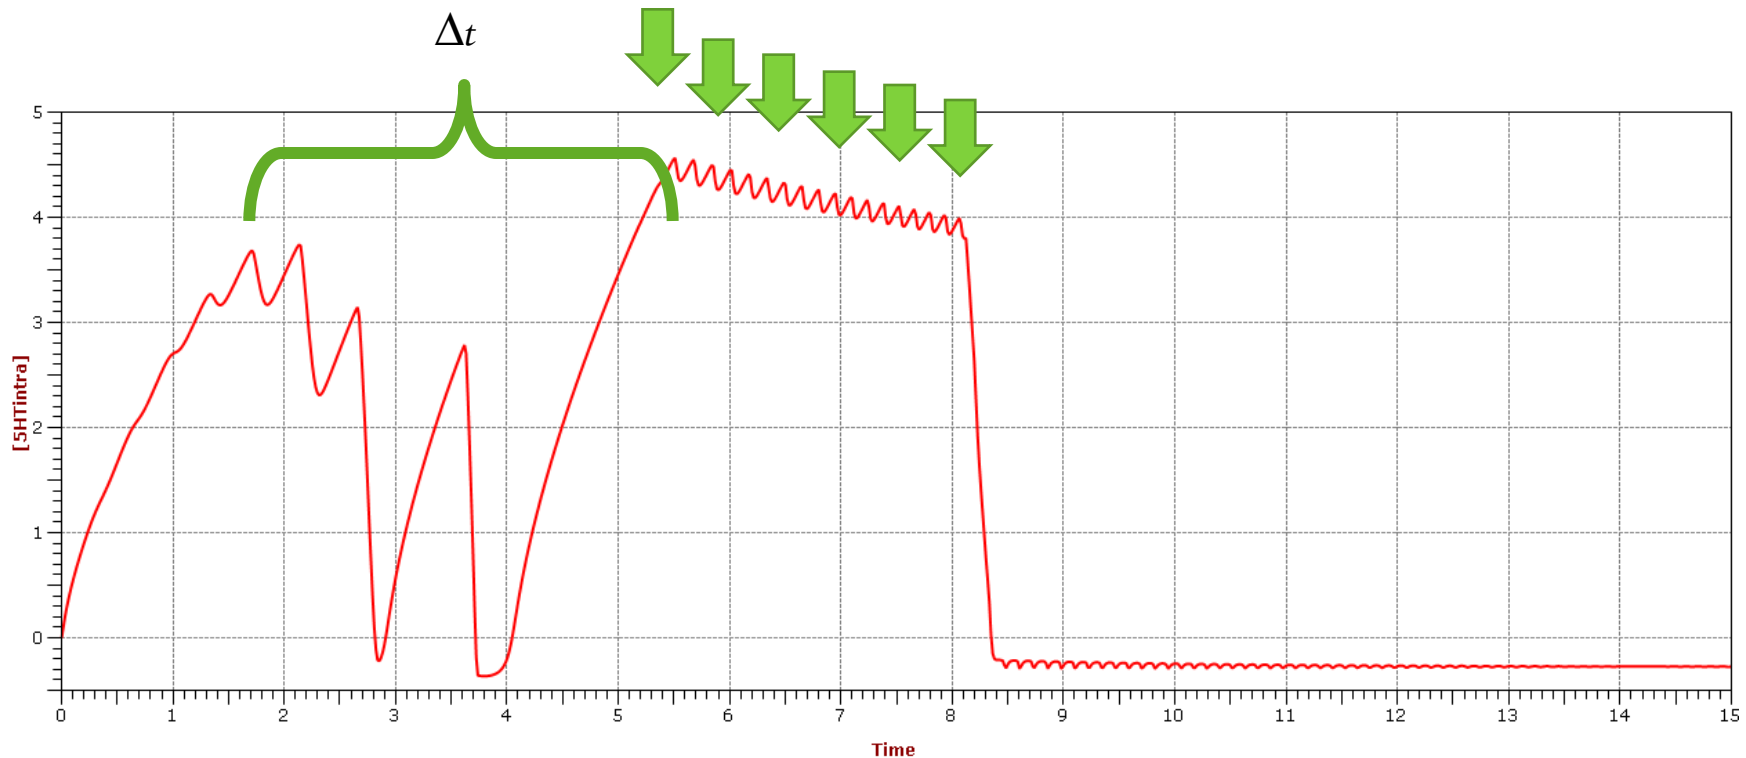

- We analyzed 51 kinetic parameters describing:
 - Serotonin synthesis
 - Serotonin degradation
 - Release into synaptic cleft
 - Receptor binding kinetics
- 5 parameters were statistically significantly lower in control subjects than in MDD patients

Results (1)

- Control subjects synthesize serotonin faster than MDD
- Time delay is greater in MDD subjects
- Controls have lower number of peaks

Results (2)

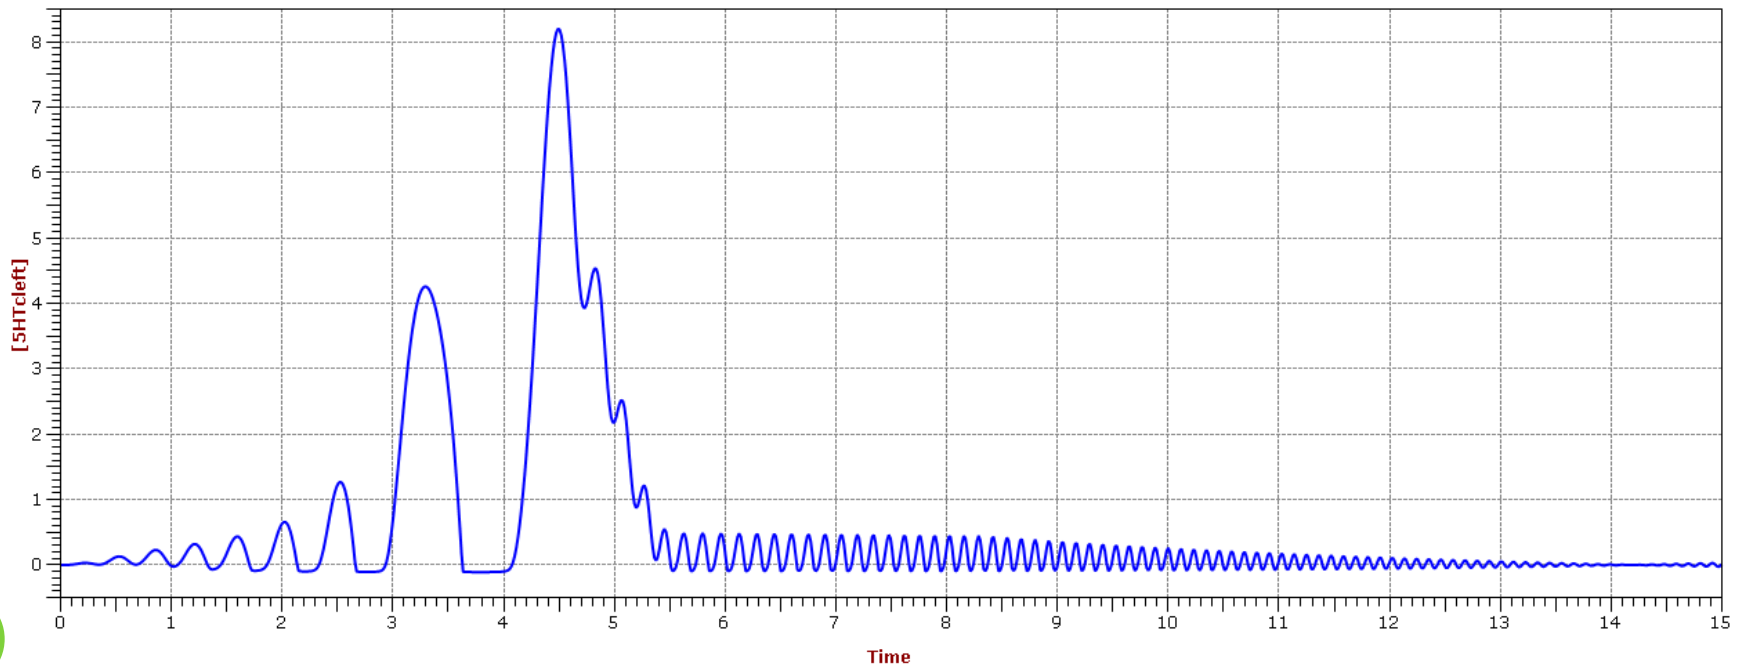

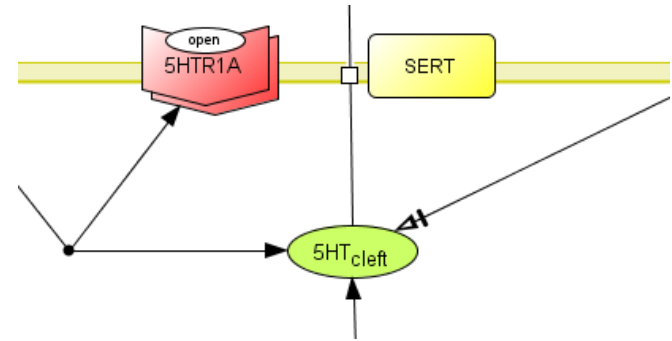

- 5-hydroxytryptophan is depleted faster in controls
- 5-hydroxytryptophan in control subjects reaches minimum in less time than in MDD
- Peak is lower in control subjects than in MDD

Results (3)

- Serotonin is released faster into synaptic cleft
- Controls have lower number of peaks

Results (4)

- MAOA deactivates faster in control subjects

PCA

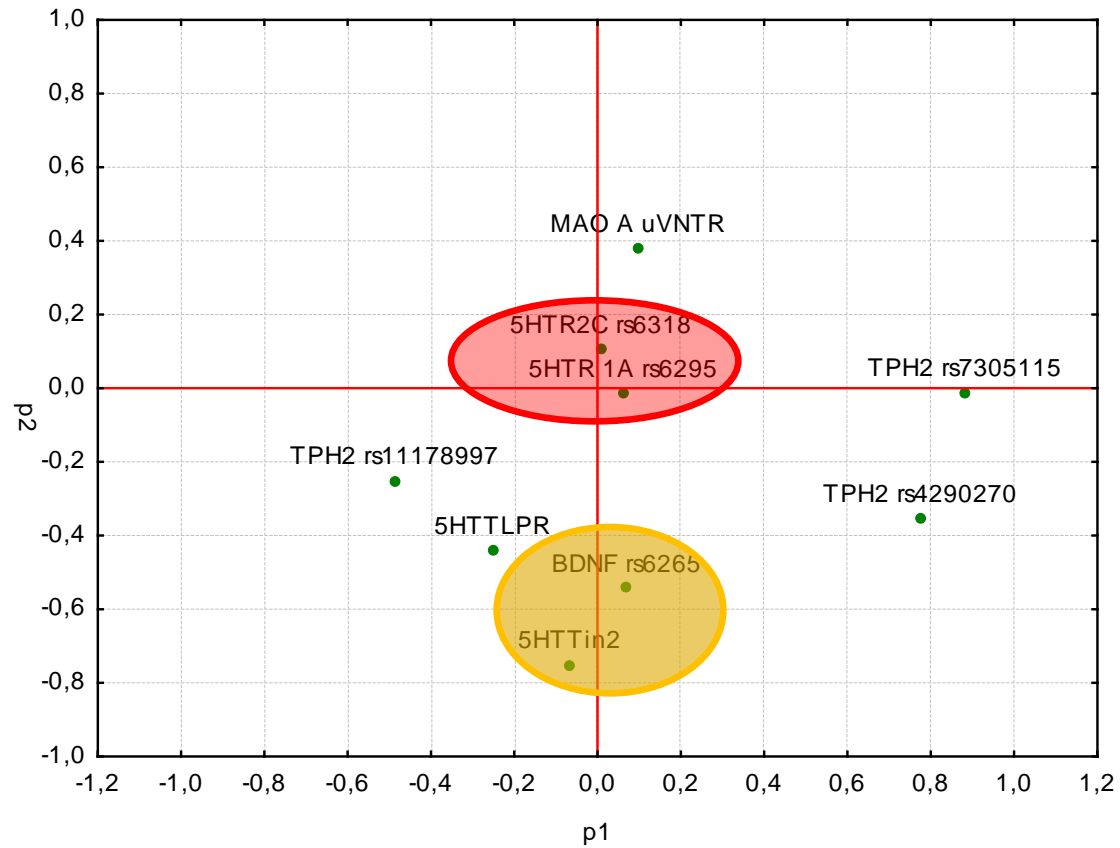

- Principal Component Analysis
- SNPs in TPH2 show the greatest importance
- 5HTT_{in2}

PCA

- Epistasis
- Multifactor dimensionality reduction
- Synergistic epistatic interaction

PCA

- Epistasis
- Multifactor dimensionality reduction
- Synergistic epistatic interaction

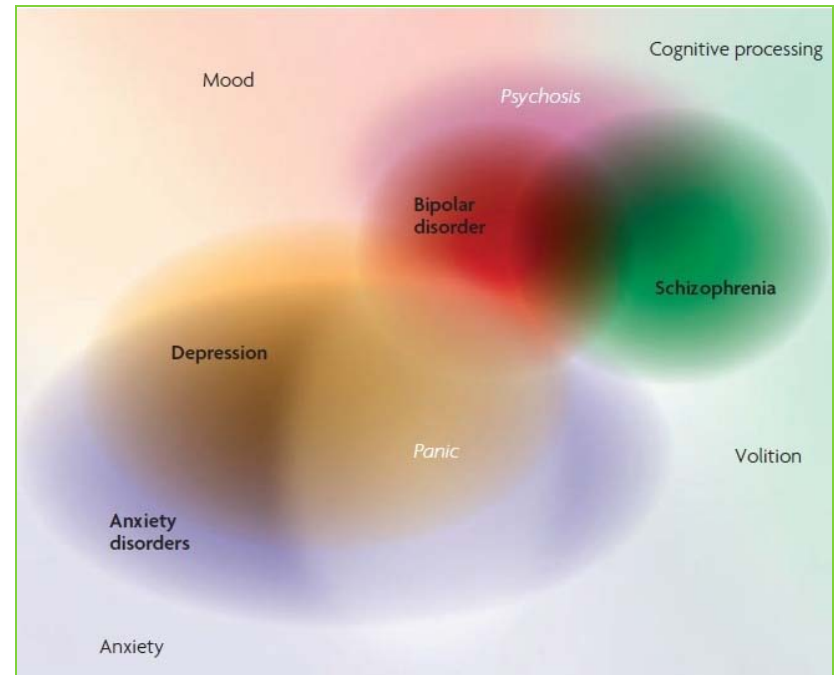

Outlook

- Generalized Linear Models
- Mathematical prediction of :
 - risk to MDD based on kinetic parameters – accuracy 82%
 - MDD type – accuracy 65%
 - Response to antidepressant therapy – accuracy: 89%
 - Suicide attempt – accuracy 100%

Outlook

- Additional genes
- Environmental effects
- Brain-region specific modeling
 - Three-, four-, n-cell system
- Disorder continuum
